

Guess the Script is a knockout-football prediction game built around the idea that every semifinal or final has a hidden storyline, and the player's job is to predict that storyline before it unfolds. It is less about trivia and more about reading momentum, pressure, and match tempo like a real fan watching the game unfold live.

Product idea

At its core, Guess the Script asks players to forecast the **shape** of a match rather than a single isolated result. Instead of only picking who wins, players predict how the game will happen: early goal, tense first half, card-heavy match, penalty shootout, late comeback, or a surprise script twist. That makes it feel smarter and more emotional than a standard scoreline predictor.

The game is designed specifically for the World Cup final stages, when every match already feels like a drama. That timing matters because it gives the product urgency, relevance, and natural replay value across only a few huge fixtures.

Core promise

Guess the Script's promise is simple: *pick the match narrative before kickoff, then see whether football follows your script*. That creates a very satisfying mix of instinct, football knowledge, luck, and post-match bragging rights.

The product should feel like fans are not just watching the semifinal or final — they are trying to read it. That emotional angle is what makes it more compelling than a generic prediction app.

What players do

The player starts before kickoff by choosing a script from a small set of options. Examples might include:

- Cagey and low-scoring.
- Fast start, then control.
- One team dominates but can't finish.
- Chaos match with cards and VAR.
- Extra time or penalties.
- Late winner decides it.

After making the prediction, the player watches the match and earns points based on how accurately the script matches reality. The experience should feel immediate and easy to grasp, with no heavy learning curve.

Why it's addictive

Guess the Script works because it taps into a natural football habit: fans constantly narrate what they think is about to happen. Turning that instinct into a game makes the player want to test their reading of the match again and again.

The addictive loop comes from:

- Streaks across semifinal 1, semifinal 2, and the final.
- Near-miss outcomes that feel almost right.
- Public comparison with friends and other fans.
- Fast scoring that rewards both boldness and accuracy.
- A limited-time event window that creates urgency.

That combination makes every match feel like a one-shot opportunity to be right.

Scoring model

The game should reward both prediction quality and timing. A good system could score for:

- Correct overall script.
- Correct first-half shape.
- Correct late-game outcome.
- Correct special events, like extra time, penalties, or cards.
- Bonus points for “perfect script” matches.

This lets the game avoid binary right/wrong frustration. Instead, players can still feel progress if they captured the overall narrative even when one detail was off.

Match script examples

The best scripts are broad enough to feel readable, but specific enough to create suspense. Good examples:

- Quiet first half, explosive second half.
- Early goal changes the whole game.
- Tactical stalemate until the final 20 minutes.
- Underdog scores first, favorite fights back.
- Match goes to penalties after a tense deadlock.

These are ideal because they fit how people actually talk about high-stakes football. They also create memorable outcomes that players want to compare with friends after the match.

Social layer

Guess the Script should be built for shared conversation. The result screen can show:

- Your chosen script.
- The actual match script.
- Your score.
- How many players got it right.
- A friend leaderboard.
- A share card for WhatsApp, X, or Instagram stories.

That social layer turns the game from a solo activity into a group ritual. For World Cup semis and the final, that matters a lot because people are already discussing every tactical shift, card, and goal in real time.

Best use case

This product is best when the user is already in match mode. It can live as a pre-match ritual, halftime re-entry point, or post-match recap game. It should not try to compete with the live broadcast; it should sit alongside it.

That makes it especially strong for:

- Friends watching together.
- WhatsApp fan groups.
- Casual viewers who want one simple prediction.
- Hardcore fans who enjoy reading the game before it happens.

Product personality

The tone of Guess the Script should feel sharp, smart, and dramatic. It should borrow the language of football storytelling — tension, momentum, chaos, control, collapse, comeback — rather than sounding like a stats app.

Visually and verbally, it should feel like the match is a story being written in real time, and the player is trying to guess the plot. That framing gives the product its identity and makes it memorable.

One-line positioning

Guess the Script is a knockout-football prediction game where fans guess the story of the match before it happens, then score points based on how closely reality follows their script.

MVP scope

A strong first version only needs:

- One match lobby.
- 6–8 script choices.
- A scoring screen.
- A live match result reveal.
- A shareable recap card.
- A tournament leaderboard.

That is enough to make it fun, fast, and repeatable without overbuilding.
